### 1. Demuestra la fórmula II.2 a partir de la fórmula:

$$\cos(\alpha + \beta) = \cos \alpha \cos \beta - \sin \alpha \sin \beta$$

$$\cos(\alpha - \beta) = \cos(\alpha + (-\beta)) = \cos \alpha \cos(-\beta) - \sin \alpha \sin(-\beta) =$$

$$= \cos \alpha \cos \beta - \sin \alpha (-\sin \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$$

### 2. Demuestra la fórmula II.3 a partir de la fórmula:

$$\operatorname{tg}(\alpha + \beta) = \frac{\operatorname{tg} \alpha + \operatorname{tg} \beta}{1 - \operatorname{tg} \alpha \operatorname{tg} \beta}$$

$$\operatorname{tg}(\alpha - \beta) = \operatorname{tg}(\alpha + (-\beta)) = \frac{\operatorname{tg} \alpha + \operatorname{tg}(-\beta)}{1 - \operatorname{tg} \alpha \operatorname{tg}(-\beta)} \stackrel{(*)}{=} \frac{\operatorname{tg} \alpha + (-\operatorname{tg} \beta)}{1 - \operatorname{tg} \alpha (-\operatorname{tg} \beta)} = \frac{\operatorname{tg} \alpha - \operatorname{tg} \beta}{1 + \operatorname{tg} \alpha \operatorname{tg} \beta}$$

$$(*) \text{ Como } \left. \begin{array}{l} \sin(-\alpha) = -\sin \alpha \\ \cos(-\alpha) = \cos \alpha \end{array} \right\} \rightarrow \operatorname{tg}(-\alpha) = -\operatorname{tg} \alpha$$

**3. Demuestra la fórmula II.3 a partir de les fórmules següents:**

$$\sin(\alpha - \beta) = \sin \alpha \cos \beta - \cos \alpha \sin \beta$$

$$\cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$$

$$\begin{aligned} \operatorname{tg}(\alpha - \beta) &= \frac{\sin(\alpha - \beta)}{\cos(\alpha - \beta)} = \frac{\sin \alpha \cos \beta - \cos \alpha \sin \beta}{\cos \alpha \cos \beta + \sin \alpha \sin \beta} \quad (*) \\ &= \frac{\frac{\sin \alpha \cos \beta}{\cos \alpha \cos \beta} - \frac{\cos \alpha \sin \beta}{\cos \alpha \cos \beta}}{\frac{\cos \alpha \cos \beta}{\cos \alpha \cos \beta} + \frac{\sin \alpha \sin \beta}{\cos \alpha \cos \beta}} = \frac{\operatorname{tg} \alpha - \operatorname{tg} \beta}{1 + \operatorname{tg} \alpha \operatorname{tg} \beta} \end{aligned}$$

(\*) Dividimos numerador y denominador por  $\cos \alpha \cos \beta$ .

**4. Si  $\sin 12^\circ = 0,2$  i  $\sin 37^\circ = 0,6$ , troba  $\cos 12^\circ$ ,  $\operatorname{tg} 12^\circ$ ,  $\cos 37^\circ$  i  $\operatorname{tg} 37^\circ$ . Calcula, després, a partir d'aquestes, les raons trigonomètriques de  $49^\circ$  i de  $25^\circ$ , utilitzant les fórmules (I) i (II).**

•  $\sin 12^\circ = 0,2$

$$\cos 12^\circ = \sqrt{1 - \sin^2 12^\circ} = \sqrt{1 - 0,04} = 0,98$$

$$\operatorname{tg} 12^\circ = \frac{0,2}{0,98} = 0,2$$

•  $\sin 37^\circ = 0,6$

$$\cos 37^\circ = \sqrt{1 - \sin^2 37^\circ} = \sqrt{1 - 0,36} = 0,8$$

$$\operatorname{tg} 37^\circ = \frac{0,6}{0,8} = 0,75$$

•  $49^\circ = 12^\circ + 37^\circ$ , luego:

$$\begin{aligned} \sin 49^\circ &= \sin(12^\circ + 37^\circ) = \sin 12^\circ \cos 37^\circ + \cos 12^\circ \sin 37^\circ = \\ &= 0,2 \cdot 0,8 + 0,98 \cdot 0,6 = 0,748 \end{aligned}$$

$$\begin{aligned} \cos 49^\circ &= \cos(12^\circ + 37^\circ) = \cos 12^\circ \cos 37^\circ - \sin 12^\circ \sin 37^\circ = \\ &= 0,98 \cdot 0,8 - 0,2 \cdot 0,6 = 0,664 \end{aligned}$$

$$\operatorname{tg} 49^\circ = \operatorname{tg}(12^\circ + 37^\circ) = \frac{\operatorname{tg} 12^\circ + \operatorname{tg} 37^\circ}{1 - \operatorname{tg} 12^\circ \operatorname{tg} 37^\circ} = \frac{0,2 + 0,75}{1 - 0,2 \cdot 0,75} = 1,12$$

(Podría calcularse  $\operatorname{tg} 49^\circ = \frac{\sin 49^\circ}{\cos 49^\circ}$ ).

•  $25^\circ = 37^\circ - 12^\circ$ , luego:

$$\begin{aligned} \sin 25^\circ &= \sin(37^\circ - 12^\circ) = \sin 37^\circ \cos 12^\circ - \cos 37^\circ \sin 12^\circ = \\ &= 0,6 \cdot 0,98 - 0,8 \cdot 0,2 = 0,428 \end{aligned}$$

$$\begin{aligned} \cos 25^\circ &= \cos(37^\circ - 12^\circ) = \cos 37^\circ \cos 12^\circ + \sin 37^\circ \sin 12^\circ = \\ &= 0,8 \cdot 0,98 + 0,6 \cdot 0,2 = 0,904 \end{aligned}$$

$$\operatorname{tg} 25^\circ = \operatorname{tg}(37^\circ - 12^\circ) = \frac{\operatorname{tg} 37^\circ - \operatorname{tg} 12^\circ}{1 + \operatorname{tg} 37^\circ \operatorname{tg} 12^\circ} = \frac{0,75 - 0,2}{1 + 0,75 \cdot 0,2} = 0,478$$

**5. Demosta la igualtat següent:**

$$\begin{aligned} \frac{\cos(a+b) + \cos(a-b)}{\sin(a+b) + \sin(a-b)} &= \frac{\cos a \cos b - \operatorname{sen} a \operatorname{sen} b + \cos a \cos b + \operatorname{sen} a \operatorname{sen} b}{\operatorname{sen} a \cos b + \cos a \operatorname{sen} b + \operatorname{sen} a \cos b - \cos a \operatorname{sen} b} = \\ &= \frac{2 \cos a \cos b}{2 \operatorname{sen} a \cos b} = \frac{\cos a}{\operatorname{sen} a} = \frac{1}{\operatorname{tg} a} \end{aligned}$$

**6. Demosta les tres fórmules (III.1), (III.2) i (III.3) fent  $\alpha = \beta$  en les fórmules (I).**

$$\operatorname{sen} 2\alpha = \operatorname{sen}(\alpha + \alpha) = \operatorname{sen} \alpha \cos \alpha + \cos \alpha \operatorname{sen} \alpha = 2 \operatorname{sen} \alpha \cos \alpha$$

$$\cos 2\alpha = \cos(\alpha + \alpha) = \cos \alpha \cos \alpha - \operatorname{sen} \alpha \operatorname{sen} \alpha = \cos^2 \alpha - \operatorname{sen}^2 \alpha$$

$$\operatorname{tg} 2\alpha = \operatorname{tg}(\alpha + \alpha) = \frac{\operatorname{tg} \alpha + \operatorname{tg} \alpha}{1 - \operatorname{tg} \alpha \operatorname{tg} \alpha} = \frac{2 \operatorname{tg} \alpha}{1 - \operatorname{tg}^2 \alpha}$$

**7. Troba les raons trigonomètriques de  $60^\circ$  a partir de les de  $30^\circ$ .**

$$\operatorname{sen} 60^\circ = \operatorname{sen}(2 \cdot 30^\circ) = 2 \operatorname{sen} 30^\circ \cos 30^\circ = 2 \cdot \frac{1}{2} \cdot \frac{\sqrt{3}}{2} = \frac{\sqrt{3}}{2}$$

$$\cos 60^\circ = \cos(2 \cdot 30^\circ) = \cos^2 30^\circ - \operatorname{sen}^2 30^\circ = \left(\frac{\sqrt{3}}{2}\right)^2 - \left(\frac{1}{2}\right)^2 = \frac{3}{4} - \frac{1}{4} = \frac{2}{4} = \frac{1}{2}$$

$$\operatorname{tg} 60^\circ = \operatorname{tg}(2 \cdot 30^\circ) = \frac{2 \operatorname{tg} 30^\circ}{1 - \operatorname{tg}^2 30^\circ} = \frac{2 \cdot \frac{\sqrt{3}}{3}}{1 - (\frac{\sqrt{3}}{3})^2} = \frac{2 \cdot \frac{\sqrt{3}}{3}}{1 - 3/9} = \frac{2 \cdot \frac{\sqrt{3}}{3}}{2/3} = \sqrt{3}$$

**8. Troba les raons trigonomètriques de  $90^\circ$  a partir de les de  $45^\circ$ .**

$$\operatorname{sen} 90^\circ = \operatorname{sen}(2 \cdot 45^\circ) = 2 \operatorname{sen} 45^\circ \cos 45^\circ = 2 \cdot \frac{\sqrt{2}}{2} \cdot \frac{\sqrt{2}}{2} = 1$$

$$\cos 90^\circ = \cos(2 \cdot 45^\circ) = \cos^2 45^\circ - \operatorname{sen}^2 45^\circ = \left(\frac{\sqrt{2}}{2}\right)^2 - \left(\frac{\sqrt{2}}{2}\right)^2 = 0$$

$$\operatorname{tg} 90^\circ = \operatorname{tg}(2 \cdot 45^\circ) = \frac{2 \operatorname{tg} 45^\circ}{1 - \operatorname{tg}^2 45^\circ} = \frac{2 \cdot 1}{1 - 1} \rightarrow \text{No existe.}$$

$$\frac{2 \operatorname{sen} \alpha - \operatorname{sen} 2\alpha}{2 \operatorname{sen} \alpha + \operatorname{sen} 2\alpha} = \frac{1 - \cos \alpha}{1 + \cos \alpha}$$

$$\frac{2 \operatorname{sen} \alpha - \operatorname{sen} 2\alpha}{2 \operatorname{sen} \alpha + \operatorname{sen} 2\alpha} = \frac{2 \operatorname{sen} \alpha - 2 \operatorname{sen} \alpha \cos \alpha}{2 \operatorname{sen} \alpha + 2 \operatorname{sen} \alpha \cos \alpha} = \frac{2 \operatorname{sen} \alpha (1 - \cos \alpha)}{2 \operatorname{sen} \alpha (1 + \cos \alpha)} = \frac{1 - \cos \alpha}{1 + \cos \alpha}$$

**10.** Seguint les indicacions que es donen, demostra detalladament les fórmules IV.1, IV.2 i IV.3.

$$\bullet \cos \alpha = \cos \left( 2 \cdot \frac{\alpha}{2} \right) = \cos^2 \frac{\alpha}{2} - \operatorname{sen}^2 \frac{\alpha}{2}$$

Por la igualdad fundamental:

$$\cos^2 \frac{\alpha}{2} + \operatorname{sen}^2 \frac{\alpha}{2} = 1 \rightarrow 1 = \cos^2 \frac{\alpha}{2} + \operatorname{sen}^2 \frac{\alpha}{2}$$

De aquí:

a) Sumando ambas igualdades:

$$1 + \cos \alpha = 2 \cos^2 \frac{\alpha}{2} \rightarrow \cos^2 \frac{\alpha}{2} = \frac{1 + \cos \alpha}{2} \rightarrow \cos \frac{\alpha}{2} = \pm \sqrt{\frac{1 + \cos \alpha}{2}}$$

b) Restando las igualdades ( $2^a - 1^a$ ):

$$1 - \cos \alpha = 2 \operatorname{sen}^2 \frac{\alpha}{2} \rightarrow \operatorname{sen}^2 \frac{\alpha}{2} = \frac{1 - \cos \alpha}{2} \rightarrow \operatorname{sen} \frac{\alpha}{2} = \pm \sqrt{\frac{1 - \cos \alpha}{2}}$$

• Por último:

$$\operatorname{tg} \frac{\alpha}{2} = \frac{\operatorname{sen} \alpha/2}{\cos \alpha/2} = \frac{\pm \sqrt{\frac{1 - \cos \alpha}{2}}}{\pm \sqrt{\frac{1 + \cos \alpha}{2}}} = \sqrt{\frac{1 - \cos \alpha}{1 + \cos \alpha}}$$

**11.** Sabent que  $\cos 78^\circ = 0,2$ , calcula  $\sin 78^\circ$  i  $\operatorname{tg} 78^\circ$ . Troba les raons trigonomètriques de  $39^\circ$  aplicant-hi les fórmules de l'angle meitat.

$$\bullet \cos 78^\circ = 0,2$$

$$\operatorname{sen} 78^\circ = \sqrt{1 - \cos^2 78^\circ} = \sqrt{1 - 0,2^2} = 0,98$$

$$\operatorname{tg} 78^\circ = \frac{0,98}{0,2} = 4,9$$

$$\bullet \operatorname{sen} 39^\circ = \operatorname{sen} \frac{78^\circ}{2} = \sqrt{\frac{1 - \cos 78^\circ}{2}} = \sqrt{\frac{1 - 0,2}{2}} = 0,63$$

$$\cos 39^\circ = \cos \frac{78^\circ}{2} = \sqrt{\frac{1 + \cos 78^\circ}{2}} = \sqrt{\frac{1 + 0,2}{2}} = 0,77$$

$$\operatorname{tg} 39^\circ = \operatorname{tg} \frac{78^\circ}{2} = \sqrt{\frac{1 - \cos 78^\circ}{1 + \cos 78^\circ}} = \sqrt{\frac{1 - 0,2}{1 + 0,2}} = 0,82$$

**12. Troba les raons trigonomètriques de  $30^\circ$  a partir de  $\cos 60^\circ = 0,5$ .**

•  $\cos 60^\circ = 0,5$

•  $\sin 30^\circ = \sin \frac{60^\circ}{2} = \sqrt{\frac{1 - 0,5}{2}} = 0,5$

$$\cos 30^\circ = \cos \frac{60^\circ}{2} = \sqrt{\frac{1 + 0,5}{2}} = 0,866$$

$$\operatorname{tg} 30^\circ = \operatorname{tg} \frac{60^\circ}{2} = \sqrt{\frac{1 - 0,5}{1 + 0,5}} = 0,577$$

**13. Troba les raons trigonomètriques de  $45^\circ$  a partir de  $\cos 90^\circ = 0$ .**

•  $\cos 90^\circ = 0$

•  $\sin 45^\circ = \sin \frac{90^\circ}{2} = \sqrt{\frac{1 - 0}{2}} = \sqrt{\frac{1}{2}} = \frac{\sqrt{2}}{2}$

$$\cos 45^\circ = \cos \frac{90^\circ}{2} = \sqrt{\frac{1 + 0}{2}} = \frac{\sqrt{2}}{2}$$

$$\operatorname{tg} 45^\circ = \operatorname{tg} \frac{90^\circ}{2} = \sqrt{\frac{1 - 0}{1 + 0}} = \sqrt{1} = 1$$

**14. Demuestra que  $2 \operatorname{tg} \alpha \cdot \sin^2 \frac{\alpha}{2} + \sin \alpha = \operatorname{tg} \alpha$ .**

**15. Demuestra que  $\frac{2 \sin \alpha - \sin 2\alpha}{2 \sin \alpha + \sin 2\alpha} = \operatorname{tg}^2 \frac{\alpha}{2}$ .**

$$\begin{aligned} \frac{2 \sin \alpha - \sin 2\alpha}{2 \sin \alpha + \sin 2\alpha} &= \frac{2 \sin \alpha - 2 \sin \alpha \cos \alpha}{2 \sin \alpha + 2 \sin \alpha \cos \alpha} = \\ &= \frac{2 \sin \alpha (1 - \cos \alpha)}{2 \sin \alpha (1 + \cos \alpha)} = \frac{1 - \cos \alpha}{1 + \cos \alpha} = \operatorname{tg}^2 \frac{\alpha}{2} \end{aligned}$$

## 16. Per demostrar les fórmules (V.3) i (V.4), fes els passos següents:

- Expressa en funció de  $\alpha$  i  $\beta$ :

$$\cos(\alpha + \beta) = \dots\dots\dots \quad \cos(\alpha - \beta) = \dots\dots\dots$$

- Suma i resta com hem fet dalt i obtindràs dues expressions.

- Substitueix en les expressions anteriors:

$$\left. \begin{array}{l} \alpha + \beta = A \\ \alpha - \beta = B \end{array} \right\} \rightarrow \alpha = \frac{A+B}{2} \quad \beta = \frac{A-B}{2}$$

- $\cos(\alpha + \beta) = \cos \alpha \cos \beta - \sin \alpha \sin \beta$

$$\cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$$

$$\text{Sumando} \rightarrow \cos(\alpha + \beta) + \cos(\alpha - \beta) = 2 \cos \alpha \cos \beta \quad (1)$$

$$\text{Restando} \rightarrow \cos(\alpha + \beta) - \cos(\alpha - \beta) = -2 \sin \alpha \sin \beta \quad (2)$$

- Llamando  $\left. \begin{array}{l} \alpha + \beta = A \\ \alpha - \beta = B \end{array} \right\} \rightarrow \alpha = \frac{A+B}{2}, \beta = \frac{A-B}{2}$  (al resolver el sistema)

- Luego, sustituyendo en (1) y (2), se obtiene:

$$(1) \rightarrow \cos A + \cos B = 2 \cos \frac{A+B}{2} \cos \frac{A-B}{2}$$

$$(2) \rightarrow \cos A - \cos B = -2 \sin \frac{A+B}{2} \sin \frac{A-B}{2}$$

## 17. Transforma en producte i calcula:

a)  $\sin 75^\circ - \sin 15^\circ$

b)  $\cos 75^\circ + \cos 15^\circ$

c)  $\cos 75^\circ - \cos 15^\circ$

$$a) \sin 75^\circ - \sin 15^\circ = 2 \cos \frac{75^\circ + 15^\circ}{2} \sin \frac{75^\circ - 15^\circ}{2} =$$

$$= 2 \cos 45^\circ \sin 30^\circ = 2 \cdot \frac{\sqrt{2}}{2} \cdot \frac{1}{2} = \frac{\sqrt{2}}{2}$$

$$b) \cos 75^\circ + \cos 15^\circ = 2 \cos \frac{75^\circ + 15^\circ}{2} \cos \frac{75^\circ - 15^\circ}{2} =$$

$$= 2 \cos 45^\circ \cos 30^\circ = 2 \cdot \frac{\sqrt{2}}{2} \cdot \frac{\sqrt{3}}{2} = \frac{\sqrt{6}}{2}$$

$$c) \cos 75^\circ - \cos 15^\circ = -2 \sin \frac{75^\circ + 15^\circ}{2} \sin \frac{75^\circ - 15^\circ}{2} =$$

$$= -2 \sin 45^\circ \sin 30^\circ = -2 \cdot \frac{\sqrt{2}}{2} \cdot \frac{1}{2} = -\frac{\sqrt{2}}{2}$$

- 18.** Expressa en forma de producte el numerador i el denominador d'aquesta fracció i simplifica'n el resultat:

$$\frac{\sin 4a + \sin 2a}{\cos 4a + \cos 2a}$$

$$\frac{\sin 4a + \sin 2a}{\cos 4a + \cos 2a} = \frac{2 \sin \frac{4a+2a}{2} \cos \frac{4a-2a}{2}}{2 \cos \frac{4a+2a}{2} \cos \frac{4a-2a}{2}} = \frac{2 \sin 3a}{2 \cos 3a} = \operatorname{tg} 3a$$

## Pàgina 137

- 1.** Resol aquestes equacions:

a)  $2 \cos^2 x + \cos x - 1 = 0$

b)  $2 \sin^2 x - 1 = 0$

c)  $\operatorname{tg}^2 x - \operatorname{tg} x = 0$

d)  $2 \sin^2 x + 3 \cos x = 3$

a)  $\cos x = \frac{-1 \pm \sqrt{1+8}}{4} = \frac{-1 \pm 3}{4} = \begin{cases} 1/2 \rightarrow x_1 = 60^\circ, x_2 = 300^\circ \\ -1 \rightarrow x_3 = 180^\circ \end{cases}$

Las tres soluciones son válidas (se comprueba en la ecuación inicial).

b)  $2 \sin^2 x - 1 = 0 \rightarrow \sin^2 x = \frac{1}{2} \rightarrow \sin x = \pm \frac{1}{\sqrt{2}} = \pm \frac{\sqrt{2}}{2}$

• Si  $\sin x = \frac{\sqrt{2}}{2} \rightarrow x_1 = 45^\circ, x_2 = 135^\circ$

• Si  $\sin x = -\frac{\sqrt{2}}{2} \rightarrow x_3 = -45^\circ = 315^\circ, x_4 = 225^\circ$

Todas las soluciones son válidas.

c)  $\operatorname{tg}^2 x - \operatorname{tg} x = 0 \rightarrow \operatorname{tg} x (\operatorname{tg} x - 1) = 0 \begin{cases} \operatorname{tg} x = 0 \rightarrow x_1 = 0^\circ, x_2 = 180^\circ \\ \operatorname{tg} x = 1 \rightarrow x_3 = 45^\circ, x_4 = 225^\circ \end{cases}$

Todas las soluciones son válidas.

d)  $2 \sin^2 x + 3 \cos x = 3 \stackrel{(*)}{\rightarrow} 2(1 - \cos^2 x) + 3 \cos x = 3$

$(*)$  Como  $\sin^2 x + \cos^2 x = 1 \rightarrow \sin^2 x = 1 - \cos^2 x$

$2 - 2 \cos^2 x + 3 \cos x = 3 \rightarrow 2 \cos^2 x - 3 \cos x + 1 = 0$

$\cos x = \frac{3 \pm \sqrt{9-8}}{4} = \frac{3 \pm 1}{4} = \begin{cases} 1 \\ 1/2 \end{cases}$

Entonces: • Si  $\cos x = 1 \rightarrow x_1 = 0^\circ$

• Si  $\cos x = \frac{1}{2} \rightarrow x_2 = 60^\circ, x_3 = -60^\circ = 300^\circ$

Las tres soluciones son válidas.

b)  $\operatorname{tg} 2x + 2 \cos x = 0$

c)  $\sqrt{2} \cos(x/2) - \cos x = 1$

d)  $2 \sin x \cos^2 x - 6 \sin^3 x = 0$

$$\begin{aligned} \text{a) } 4 \cos 2x + 3 \cos x = 1 &\rightarrow 4(\cos^2 x - \sin^2 x) + 3 \cos x = 1 \rightarrow \\ &\rightarrow 4(\cos^2 x - (1 - \cos^2 x)) + 3 \cos x = 1 \rightarrow 4(2 \cos^2 x - 1) + 3 \cos x = 1 \rightarrow \\ &\rightarrow 8 \cos^2 x - 4 + 3 \cos x = 1 \Rightarrow 8 \cos^2 x + 3 \cos x - 5 = 0 \rightarrow \\ &\rightarrow \cos x = \frac{-3 \pm \sqrt{9 + 160}}{16} = \frac{-3 \pm 13}{16} = \begin{cases} 10/16 = 5/8 = 0,625 \\ -1 \end{cases} \end{aligned}$$

- Si  $\cos x = 0,625 \rightarrow x_1 = 51^\circ 19' 4,13''$ ,  $x_2 = -51^\circ 19' 4,13''$
- Si  $\cos x = -1 \rightarrow x_3 = 180^\circ$

Al comprobar las soluciones, las tres son válidas.

$$\begin{aligned} \text{b) } \operatorname{tg} 2x + 2 \cos x = 0 &\rightarrow \frac{2 \operatorname{tg} x}{1 - \operatorname{tg}^2 x} + 2 \cos x = 0 \rightarrow \\ &\rightarrow \frac{\operatorname{tg} x}{1 - \operatorname{tg}^2 x} + \cos x = 0 \rightarrow \frac{\operatorname{sen} x / \cos x}{1 - (\operatorname{sen}^2 x / \cos^2 x)} + \cos x = 0 \rightarrow \\ &\rightarrow \frac{\operatorname{sen} x \cos x}{\cos^2 x - \operatorname{sen}^2 x} + \cos x = 0 \rightarrow \operatorname{sen} x \cos x + \cos x (\cos^2 x - \operatorname{sen}^2 x) = 0 \rightarrow \\ &\rightarrow \cos x (\operatorname{sen} x + \cos^2 x - \operatorname{sen}^2 x) = 0 \rightarrow \cos x (\operatorname{sen} x + 1 - \operatorname{sen}^2 x - \operatorname{sen}^2 x) \rightarrow \\ &\rightarrow \cos x (1 + \operatorname{sen} x - 2 \operatorname{sen}^2 x) = 0 \rightarrow \\ &\rightarrow \begin{cases} \cos x = 0 \\ 1 + \operatorname{sen} x - 2 \operatorname{sen}^2 x = 0 \rightarrow \operatorname{sen} x = \frac{-1 \pm \sqrt{1 + 8}}{-4} = \begin{cases} -1/2 \\ 1 \end{cases} \end{cases} \end{aligned}$$

- Si  $\cos x = 0 \rightarrow x_1 = 90^\circ$ ,  $x_2 = 270^\circ$
- Si  $\operatorname{sen} x = -\frac{1}{2} \rightarrow x_3 = 210^\circ$ ,  $x_4 = 330^\circ = -30^\circ$
- Si  $\operatorname{sen} x = 1 \rightarrow x_5 = 90^\circ = x_1$

Al comprobar las soluciones, vemos que todas ellas son válidas.

$$\begin{aligned} \text{c) } \sqrt{2} \cos \frac{x}{2} - \cos x = 1 &\rightarrow \sqrt{2} \sqrt{\frac{1 + \cos x}{2}} - \cos x = 1 \rightarrow \\ &\rightarrow \sqrt{1 + \cos x} - \cos x = 1 \rightarrow \sqrt{1 - \cos x} = 1 + \cos x \rightarrow \\ &\rightarrow 1 + \cos x = 1 + \cos^2 x + 2 \cos x \rightarrow \cos^2 x + \cos x = 0 \rightarrow \cos x (\cos x + 1) = 0 \\ &\bullet \text{ Si } \cos x = 0 \rightarrow x_1 = 90^\circ, x_2 = 270^\circ \\ &\bullet \text{ Si } \cos x = -1 \rightarrow x_3 = 180^\circ \end{aligned}$$

Al comprobar las soluciones, podemos ver que las únicas válidas son:

$$x_1 = 90^\circ \text{ y } x_3 = 180^\circ$$

$$d) 2 \operatorname{sen} x \cos^2 x - 6 \operatorname{sen}^3 x = 0 \rightarrow 2 \operatorname{sen} x (\cos^2 x - 3 \operatorname{sen}^2 x) = 0 \rightarrow$$

$$\rightarrow 2 \operatorname{sen} x (\cos^2 x + \operatorname{sen}^2 x - 4 \operatorname{sen}^2 x) = 0 \rightarrow 2 \operatorname{sen} x (1 - 4 \operatorname{sen}^2 x) = 0$$

• Si  $\operatorname{sen} x = 0 \rightarrow x_1 = 0^\circ, x_2 = 180^\circ$

• Si  $\operatorname{sen}^2 x = \frac{1}{4} \rightarrow \operatorname{sen} x = \pm \frac{1}{2} \Rightarrow x_3 = 30^\circ, x_4 = 150^\circ, x_5 = 210^\circ, x_6 = 330^\circ$

Comprobamos las soluciones y observamos que son válidas todas ellas.

**3. Transforma en producte  $\sin 3x - \sin x$  i resol després l'equació  $\sin 3x - \sin x = 0$ .**

$$\operatorname{sen} 3x - \operatorname{sen} x = 0 \rightarrow 2 \cos \frac{3x+x}{2} \operatorname{sen} \frac{3x-x}{2} = 0 \rightarrow 2 \cos 2x \operatorname{sen} x = 0 \rightarrow$$

$$\rightarrow \begin{cases} \cos 2x = 0 \\ \operatorname{sen} x = 0 \end{cases}$$

• Si  $\cos 2x = 0 \rightarrow \begin{cases} 2x = 90^\circ & \rightarrow x_1 = 45^\circ \\ 2x = 270^\circ & \rightarrow x_2 = 135^\circ \\ 2x = 90^\circ + 360^\circ & \rightarrow x_3 = 225^\circ \\ 2x = 270^\circ + 360^\circ & \rightarrow x_4 = 315^\circ \end{cases}$

• Si  $\operatorname{sen} x = 0 \Rightarrow x_5 = 0^\circ, x_6 = 180^\circ$

Comprobamos que las seis soluciones son válidas.

**4. Resol les equacions trigonomètriques següents:**

a)  $\sin(\pi - x) = \cos\left(\frac{3\pi}{2} - x\right) + \cos \pi$

b)  $\sin\left(\frac{\pi}{4} - x\right) + \sqrt{2} \sin x = 0$

$$\left. \begin{array}{l} a) \operatorname{sen}(\pi - x) = \operatorname{sen} x \\ \cos\left(\frac{3\pi}{2} - x\right) = -\operatorname{sen} x \\ \cos \pi = -1 \end{array} \right\} \text{Entonces, la ecuación queda:}$$

$$\operatorname{sen} x = -\operatorname{sen} x - 1 \rightarrow 2 \operatorname{sen} x = -1 \rightarrow \operatorname{sen} x = \frac{-1}{2}$$

Si  $\operatorname{sen} x = \frac{-1}{2} \rightarrow x_1 = \frac{7\pi}{6} \text{ rad}, x_2 = \frac{11\pi}{6} \text{ rad}$

Al comprobar vemos:

$$x_1 = \frac{7\pi}{6} \rightarrow \operatorname{sen}(\pi - x) = \operatorname{sen}\left(\pi - \frac{7\pi}{6}\right) = \operatorname{sen} \frac{-\pi}{6} = \frac{-1}{2}$$

$$\cos\left(\frac{3\pi}{2} - x\right) = \cos\left(\frac{3\pi}{2} - \frac{7\pi}{6}\right) = \cos \frac{2\pi}{6} = \cos \frac{\pi}{3} = \frac{1}{2}$$

Luego la solución es válida, pues:

$$\operatorname{sen}(\pi - x) = \frac{-1}{2} = \cos\left(\frac{3\pi}{2} - x\right) + \cos \pi = \frac{1}{2} + (-1)$$

$$x_2 = \frac{11\pi}{6} \rightarrow \operatorname{sen}(\pi - x) = \operatorname{sen}\left(\pi - \frac{11\pi}{6}\right) = \operatorname{sen}\left(\frac{-5\pi}{6}\right) = -\frac{1}{2}$$

$$\cos\left(\frac{3\pi}{2} - x\right) = \cos\left(\frac{3\pi}{2} - \frac{11\pi}{6}\right) = \cos\left(\frac{-2\pi}{6}\right) = \cos\left(\frac{-\pi}{3}\right) = \frac{1}{2}$$

Luego también es válida esta solución, pues:

$$\operatorname{sen}(\pi - x) = \frac{-1}{2} = \cos\left(\frac{3\pi}{2} - x\right) + \cos \pi = \frac{1}{2} + (-1)$$

Por tanto, las dos soluciones son válidas:  $x_1 = \frac{7\pi}{6}$  rad y  $x_2 = \frac{11\pi}{6}$  rad

$$b) \operatorname{sen}\left(\frac{\pi}{4} - x\right) = \operatorname{sen} \frac{\pi}{4} \cos x - \cos \frac{\pi}{4} \operatorname{sen} x = \frac{\sqrt{2}}{2} \cos x - \frac{\sqrt{2}}{2} \operatorname{sen} x$$

Luego la ecuación queda:

$$\frac{\sqrt{2}}{2} \cos x - \frac{\sqrt{2}}{2} \operatorname{sen} x + \sqrt{2} \operatorname{sen} x = 0 \rightarrow \frac{\sqrt{2}}{2} \cos x + \frac{\sqrt{2}}{2} \operatorname{sen} x = 0 \rightarrow$$

$$\rightarrow \cos x + \operatorname{sen} x = 0 \rightarrow \cos x = -\operatorname{sen} x \rightarrow x_1 = \frac{3\pi}{4} \text{ rad, } x_2 = \frac{7\pi}{4} \text{ rad}$$

Comprobamos que ninguna solución vale. Luego la ecuación no tiene solución.

### 5. Escriu, en radiants, l'expressió general de tots els angles que verifiquen:

a)  $\operatorname{tg} x = -\sqrt{3}$

b)  $\sin x = \cos x$

c)  $\sin^2 x = 1$

d)  $\sin x = \operatorname{tg} x$

a)  $x = 120^\circ + k \cdot 360^\circ$  o bien  $x = 300^\circ + k \cdot 360^\circ$

Las dos soluciones quedan recogidas en:

$$x = 120^\circ + k \cdot 180^\circ = \frac{2\pi}{3} + k \pi \text{ rad} = x \text{ con } k \in \mathbb{Z}$$

b)  $x = \frac{\pi}{4} + k \pi \text{ rad con } k \in \mathbb{Z}$

$$c) \left. \begin{array}{l} \text{Si } \sin x = 1 \rightarrow x = \frac{\pi}{2} + 2k \pi \text{ rad} \\ \text{Si } \sin x = -1 \rightarrow x = \frac{3\pi}{2} + 2k \pi \text{ rad} \end{array} \right\} \rightarrow x = \frac{\pi}{2} + k \pi \text{ rad con } k \in \mathbb{Z}$$

d) En ese caso debe ocurrir que:

$$\left. \begin{array}{l} \text{O bien } \sin x = 0 \rightarrow x = k \pi \text{ rad} \\ \text{O bien } \cos x = 1 \rightarrow x = 2k \pi \text{ rad} \end{array} \right\} \rightarrow x = k \pi \text{ rad con } k \in \mathbb{Z}$$

### Fórmules trigonomètriques

**10** Troba les raons trigonomètriques de l'angle de  $75^\circ$  sabent que  $75^\circ = 30^\circ + 45^\circ$ .

$$\begin{aligned} \sin 75^\circ &= \sin (30^\circ + 45^\circ) = \sin 30^\circ \cos 45^\circ + \cos 30^\circ \sin 45^\circ = \\ &= \frac{1}{2} \cdot \frac{\sqrt{2}}{2} + \frac{\sqrt{3}}{2} \cdot \frac{\sqrt{2}}{2} = \frac{\sqrt{2} + \sqrt{6}}{4} \end{aligned}$$

$$\begin{aligned}
 \cos 75^\circ &= \cos (30^\circ + 45^\circ) = \cos 30^\circ \cos 45^\circ - \sin 30^\circ \sin 45^\circ = \\
 &= \frac{\sqrt{3}}{2} \cdot \frac{\sqrt{2}}{2} - \frac{1}{2} \cdot \frac{\sqrt{2}}{2} = \frac{\sqrt{6} - \sqrt{2}}{4} \\
 \operatorname{tg} 75^\circ &= \operatorname{tg} (30^\circ + 45^\circ) = \frac{\operatorname{tg} 30^\circ + \operatorname{tg} 45^\circ}{1 - \operatorname{tg} 30^\circ \operatorname{tg} 45^\circ} = \frac{\sqrt{3}/3 + 1}{1 - \sqrt{3}/3} = \frac{(\sqrt{3} + 3)/3}{(\sqrt{3} - 3)/3} = \\
 &= \frac{3 + \sqrt{3}}{3 - \sqrt{3}} = \frac{(3 + \sqrt{3})^2}{9 - 3} = \frac{9 + 3 + 6\sqrt{3}}{6} = \\
 &= \frac{12 + 6\sqrt{3}}{6} = 2 + \sqrt{3}
 \end{aligned}$$

NOTA: También podemos resolverlo como sigue:

$$\begin{aligned}
 \operatorname{tg} 75^\circ &= \frac{\sin 75^\circ}{\cos 75^\circ} = \frac{\sqrt{2} + \sqrt{6}}{\sqrt{6} - \sqrt{2}} = \frac{(\sqrt{2} + \sqrt{6})^2}{6 - 2} = \frac{2 + 6 + 2\sqrt{12}}{4} = \\
 &= \frac{8 + 4\sqrt{3}}{4} = 2 + \sqrt{3}
 \end{aligned}$$

**11** Sabent que  $\sin x = \frac{3}{5}$  i que  $\frac{\pi}{2} < x < \pi$ , calcula, sense trobar prèviament el valor de  $x$ :

a)  $\sin 2x$                       b)  $\operatorname{tg} \frac{x}{2}$                       c)  $\sin \left(x + \frac{\pi}{6}\right)$   
 d)  $\cos \left(x - \frac{\pi}{3}\right)$               e)  $\cos \frac{x}{2}$                       f)  $\operatorname{tg} \left(x + \frac{\pi}{4}\right)$

• Calcula  $\cos x$  i  $\operatorname{tg} x$  i després aplica-bi les fórmules.

$$\cos x = -\sqrt{1 - \sin^2 x} = -\sqrt{1 - \frac{9}{25}} = -\frac{4}{5} \quad (\text{Negativo, por ser del 2.º cuadrante}).$$

$$\operatorname{tg} x = \frac{\sin x}{\cos x} = -\frac{3}{4}$$

$$\text{a) } \sin 2x = 2 \sin x \cos x = 2 \cdot \frac{3}{5} \cdot \left(-\frac{4}{5}\right) = -\frac{24}{25}$$

$$\text{b) } \operatorname{tg} \frac{x}{2} = \sqrt{\frac{1 - \cos x}{1 + \cos x}} = \sqrt{\frac{1 - (-4/5)}{1 + (-4/5)}} = \sqrt{\frac{9/5}{1/5}} = 3$$

Signo positivo, pues si  $x \in 2.^\circ$  cuadrante, entonces  $\frac{x}{2} \in 1.^\text{er}$  cuadrante.

$$\begin{aligned}

$$d) \cos \left( x - \frac{\pi}{3} \right) = \cos x \cos \frac{\pi}{3} + \operatorname{sen} x \operatorname{sen} \frac{\pi}{3} =$$

$$= \left( -\frac{4}{5} \right) \cdot \frac{1}{2} + \frac{3}{5} \cdot \frac{\sqrt{3}}{2} = \frac{3\sqrt{3} - 4}{10}$$

$$e) \cos \frac{x}{2} \stackrel{(*)}{=} \sqrt{\frac{1 + \cos x}{2}} = \sqrt{\frac{1 - 4/5}{2}} = \sqrt{\frac{1/5}{2}} = \sqrt{\frac{1}{10}} = \frac{\sqrt{10}}{10}$$

(\*) Signo positivo, porque  $\frac{x}{2} \in 1.\text{er}$  cuadrante.

$$f) \operatorname{tg} \left( x + \frac{\pi}{4} \right) = \frac{\operatorname{tg} x + \operatorname{tg} \pi/4}{1 - \operatorname{tg} x \operatorname{tg} \pi/4} = \frac{-3/4 + 1}{1 - (-3/4) \cdot 1} = \frac{1 - 3/4}{1 + 3/4} = \frac{1}{7}$$

$$\operatorname{tg} 15^\circ = \frac{\operatorname{sen} 15^\circ}{\cos 15^\circ} = \frac{\sqrt{6} - \sqrt{2}}{\sqrt{6} + \sqrt{2}} = \frac{6 + 2 - 2\sqrt{12}}{6 - 2} =$$

$$= \frac{8 - 4\sqrt{3}}{4} = 2 - \sqrt{3} = 0,267949$$

$$b) \operatorname{sen} 15^\circ = \operatorname{sen} \frac{30^\circ}{2} = \sqrt{\frac{1 - \cos 30^\circ}{2}} = \sqrt{\frac{1 - \sqrt{3}/2}{2}} = \sqrt{\frac{2 - \sqrt{3}}{4}} =$$

b)  $\sin^2 x - \sin x = 0$

c)  $2 \cos^2 x - \sqrt{3} \cos x = 0$

• b) i c) són equacions de  $2n$  grau incompletes.

Las cuatro soluciones son válidas. Luego:

Comprobamos las posibles soluciones en la ecuación inicial y vemos que las cuatro son válidas.

Entonces:

$$\left. \begin{aligned} x_1 &= k \cdot 360^\circ = 2k\pi \\ x_2 &= 180^\circ + k \cdot 360^\circ = \pi + 2k\pi \\ x_3 &= 30^\circ + k \cdot 360^\circ = \frac{\pi}{6} + 2k\pi \\ x_4 &= 210^\circ + k \cdot 360^\circ = \frac{7\pi}{6} + 2k\pi \end{aligned} \right\} \text{ con } k \in \mathbb{Z}$$

b)  $4 \sin^2 x + \sin x \cos x - 3 \cos^2 x = 0$

• Dividix entre  $\cos^2 x$  i obtindràs una equació amb  $\operatorname{tg} x$ .

c)  $\cos^2 \frac{x}{2} + \cos x - \frac{1}{2} = 0$

d)  $\operatorname{tg}^2 \frac{x}{2} + 1 = \cos x$

$$c) \frac{1 + \cos x}{2} + \cos x - \frac{1}{2} = 0 \rightarrow 1 + \cos x + 2 \cos x - 1 = 0 \rightarrow$$

$$\rightarrow 3 \cos x = 0 \rightarrow \cos x = 0 \rightarrow x_1 = 90^\circ, x_2 = 270^\circ$$

Las dos soluciones son válidas. Luego:

$$\left. \begin{aligned} x_1 = 90^\circ + k \cdot 360^\circ &= \frac{\pi}{2} + 2k\pi \\ x_2 = 270^\circ + k \cdot 360^\circ &= \frac{3\pi}{2} + 2k\pi \end{aligned} \right\} \text{ con } k \in \mathbb{Z}$$

Agrupando las soluciones:

$$x = 90^\circ + k \cdot 180^\circ = \frac{\pi}{2} + k\pi \quad \text{con } k \in \mathbb{Z}$$

$$d) \frac{1 - \cos x}{1 + \cos x} + 1 = \cos x \rightarrow 1 - \cos x + 1 + \cos x = \cos x + \cos^2 x \rightarrow$$

$$\rightarrow 2 = \cos x + \cos^2 x \rightarrow \cos^2 x + \cos x - 2 = 0 \rightarrow$$

Luego:  $x = k \cdot 360^\circ = 2k\pi$  con  $k \in \mathbb{Z}$

$$e) 2 \cdot \frac{1 - \cos x}{2} + \cos^2 x - \sin^2 x = 0 \rightarrow$$

$$\rightarrow 1 - \cos x + \cos^2 x - (1 - \cos^2 x) = 0 \rightarrow$$

Se comprueba que son válidas todas. Por tanto:

$$\left. \begin{aligned} x_1 = 90^\circ + k \cdot 360^\circ &= \frac{\pi}{2} + 2k\pi \\ x_2 = 270^\circ + k \cdot 360^\circ &= \frac{3\pi}{2} + 2k\pi \\ x_3 = 60^\circ + k \cdot 360^\circ &= \frac{\pi}{3} + 2k\pi \\ x_4 = 300^\circ + k \cdot 360^\circ &= \frac{5\pi}{3} + 2k\pi \end{aligned} \right\} \text{ con } k \in \mathbb{Z}$$

Agrupando las soluciones quedaría:

### PER A RESOLDRE

- 26** En una circumferència de 16 cm de radi, un arc fa 20 cm. Troba'n l'angle central en graus i en radians.

Como la circumferència completa (100,53 cm) son  $2\pi$  rad, entones:

$$\frac{100,53}{20} = \frac{2\pi}{\alpha} \rightarrow \alpha = \frac{20 \cdot 2\pi}{100,53} = 1,25 \text{ rad}$$

$$\alpha = \frac{360^\circ}{2\pi} \cdot 1,25 = 71^\circ 37' 11''$$

- 27** En una determinada circumferència, a un arc de 12 cm de longitud li correspon un angle de 2,5 radians.

Quin és el radi d'aquesta circumferència?

$$\frac{2,5 \text{ rad}}{1 \text{ rad}} = \frac{12 \text{ cm}}{R \text{ cm}} \rightarrow R = \frac{12}{2,5} = 4,8 \text{ cm}$$

- 28** Troba, en radians, l'angle comprès entre 0 i  $2\pi$  tal que les seues raons trigonomètriques coincidisquen amb les de  $\frac{11\pi}{4}$ .

$$0 < \alpha < 2\pi$$

$$\frac{11\pi}{4} = \frac{8\pi + 3\pi}{4} \rightarrow \frac{11\pi}{4} = 2\pi + \frac{3\pi}{4} \Rightarrow \alpha = \frac{3\pi}{4}$$

- 29** Demostra:

$$\frac{\cos(\alpha - \beta)}{\cos(\alpha + \beta)} = \frac{1 + \operatorname{tg} \alpha \operatorname{tg} \beta}{1 - \operatorname{tg} \alpha \operatorname{tg} \beta}$$

$$\frac{\cos(\alpha - \beta)}{\cos(\alpha + \beta)} = \frac{\cos \alpha \cos \beta + \operatorname{sen} \alpha \operatorname{sen} \beta}{\cos \alpha \cos \beta - \operatorname{sen} \alpha \operatorname{sen} \beta} \stackrel{(*)}{=}$$

(\*) Dividimos numerador y denominador entre:

$$\cos \alpha \cos \beta$$

$$= \frac{\frac{\cos \alpha \cos \beta}{\cos \alpha \cos \beta} + \frac{\operatorname{sen} \alpha \operatorname{sen} \beta}{\cos \alpha \cos \beta}}{\frac{\cos \alpha \cos \beta}{\cos \alpha \cos \beta} - \frac{\operatorname{sen} \alpha \operatorname{sen} \beta}{\cos \alpha \cos \beta}} = \frac{1 + \operatorname{tg} \alpha \operatorname{tg} \beta}{1 - \operatorname{tg} \alpha \operatorname{tg} \beta}$$

- 30** Simplifica l'expressió:

$$\frac{\sin 2\alpha}{1 - \cos^2 \alpha}$$

Calcula'n el valor per a  $\alpha = \frac{\pi}{4}$ .

$$\frac{\sin 2\alpha}{1 - \cos^2 \alpha} = \frac{2 \operatorname{sen} \alpha \cos \alpha}{\operatorname{sen}^2 \alpha} = \frac{2 \cos \alpha}{\operatorname{sen} \alpha}$$

$$\text{Por tanto, si } \alpha = \frac{\pi}{4} \Rightarrow \frac{\sin 2\alpha}{1 - \cos^2 \alpha} = \frac{2 \cos \alpha}{\operatorname{sen} \alpha} = \frac{2 \cdot \left(\frac{\sqrt{2}}{2}\right)}{\frac{\sqrt{2}}{2}} = 2$$

**31** Prova que:

$$\frac{2\sin \alpha - \sin 2\alpha}{2\sin \alpha + \sin 2\alpha} = \operatorname{tg}^2 \frac{\alpha}{2}$$

$$\begin{aligned} \frac{2\sin \alpha - \sin 2\alpha}{2\sin \alpha + \sin 2\alpha} &= \frac{2\sin \alpha - 2\sin \alpha \cos \alpha}{2\sin \alpha + 2\sin \alpha \cos \alpha} = \frac{2\sin \alpha (1 - \cos \alpha)}{2\sin \alpha (1 + \cos \alpha)} = \\ &= \frac{1 - \cos \alpha}{1 + \cos \alpha} = \operatorname{tg}^2 \frac{\alpha}{2} \end{aligned}$$

**32** Simplifica:

$$\frac{2\cos (45^\circ + \alpha) \cos (45^\circ - \alpha)}{\cos 2\alpha}$$

• En desenvolupar el numerador obtindràs una diferència de quadrats.

$$\begin{aligned} \frac{2\cos (45^\circ + \alpha) \cos (45^\circ - \alpha)}{\cos 2\alpha} &= \\ &= \frac{2(\cos 45^\circ \cos \alpha - \sin 45^\circ \sin \alpha)(\cos 45^\circ \cos \alpha + \sin 45^\circ \sin \alpha)}{\cos^2 \alpha - \sin^2 \alpha} = \\ &= \frac{2(\cos^2 45^\circ \cos^2 \alpha - \sin^2 45^\circ \sin^2 \alpha)}{\cos^2 \alpha - \sin^2 \alpha} = \\ &= \frac{2 \cdot [(\sqrt{2}/2)^2 \cos^2 \alpha - (\sqrt{2}/2)^2 \sin^2 \alpha]}{\cos^2 \alpha - \sin^2 \alpha} = \frac{2 \cdot 1/2 \cos^2 \alpha - 2 \cdot 1/2 \sin^2 \alpha}{\cos^2 \alpha - \sin^2 \alpha} = \\ &= \frac{\cos^2 \alpha - \sin^2 \alpha}{\cos^2 \alpha - \sin^2 \alpha} = 1 \end{aligned}$$

c)  $\cos x \cos 2x + 2 \cos^2 x = 0$

b)  $\frac{\sin 5x + \sin 3x}{\cos x + \cos 3x} = 1$

c)  $\frac{\sin 3x + \sin x}{\cos 3x + \cos x} = \sqrt{3}$

d)  $\sin 3x - \cos 3x = \sin x - \cos x$

• *Transforma les sumes o diferències de sinus i cosinus en productes.*

a)  $2 \cos \frac{3x+x}{2} \sin \frac{3x-x}{2} = \cos 2x$

$$2 \cos 2x \sin x = \cos 2x \rightarrow 2 \sin x = 1 \rightarrow \sin x = \frac{1}{2} \rightarrow x_1 = 30^\circ, x_2 = 150^\circ$$

Comprobando, vemos que las dos soluciones son válidas. Luego:

$$\left. \begin{aligned} x_1 &= 30^\circ + k \cdot 360^\circ = \frac{\pi}{6} + 2k \pi \\ x_2 &= 150^\circ + k \cdot 360^\circ = \frac{5\pi}{6} + 2k \pi \end{aligned} \right\} \text{ con } k \in \mathbb{Z}$$

Podemos comprobar que las cuatro soluciones son válidas. Agrupándolas:

a)  $\cos(\alpha + \beta) \cdot \cos(\alpha - \beta) = \cos^2 \alpha - \sin^2 \beta$

b)  $\sin^2\left(\frac{\alpha + \beta}{2}\right) - \sin^2\left(\frac{\alpha - \beta}{2}\right) = \sin \alpha \cdot \sin \beta$

c)  $\cos^2\left(\frac{\alpha - \beta}{2}\right) - \cos^2\left(\frac{\alpha + \beta}{2}\right) = \sin \alpha \cdot \sin \beta$

 $= \cos^2 \alpha - \sin^2 \beta$

b) El primer miembro de la igualdad es una diferencia de cuadrados, luego podemos factorizarlo como una suma por una diferencia:

$$\begin{aligned} & \left[ \sin\left(\frac{\alpha + \beta}{2}\right) + \sin\left(\frac{\alpha - \beta}{2}\right) \right] \cdot \left[ \sin\left(\frac{\alpha + \beta}{2}\right) - \sin\left(\frac{\alpha - \beta}{2}\right) \right]^{(*)} = \\ & = \left[ 2 \sin \frac{\alpha}{2} \cos \frac{\beta}{2} \right] \cdot \left[ 2 \cos \frac{\alpha}{2} \sin \frac{\beta}{2} \right] = \\ & = 4 \sqrt{\frac{1 - \cos \alpha}{2}} \cdot \sqrt{\frac{1 + \cos \beta}{2}} \cdot \sqrt{\frac{1 + \cos \alpha}{2}} \cdot \sqrt{\frac{1 - \cos \beta}{2}} = \\ & = \sqrt{(1 - \cos \alpha) (1 + \cos \beta) (1 + \cos \alpha) (1 - \cos \beta)} = \\ & = \sqrt{(1 - \cos^2 \alpha) (1 - \cos^2 \beta)} = \sqrt{\sin^2 \alpha \cdot \sin^2 \beta} = \sin \alpha \sin \beta \end{aligned}$$

(\*) Transformamos la suma y la diferencia en productos, teniendo en cuenta que:

$$\frac{\alpha + \beta}{2} + \frac{\alpha - \beta}{2} = \alpha \quad \text{y} \quad \frac{\alpha + \beta}{2} - \frac{\alpha - \beta}{2} = \beta$$

c) Procedemos de manera análoga al apartado anterior, pero ahora:

$$\frac{\alpha - \beta}{2} + \frac{\alpha + \beta}{2} = \alpha \quad \text{y} \quad \frac{\alpha - \beta}{2} - \frac{\alpha + \beta}{2} = -\beta$$

$$\begin{aligned} & \cos^2\left(\frac{\alpha - \beta}{2}\right) - \cos^2\left(\frac{\alpha + \beta}{2}\right) = \\ & = \left[ \cos\left(\frac{\alpha - \beta}{2}\right) + \cos\left(\frac{\alpha + \beta}{2}\right) \right] \cdot \left[ \cos\left(\frac{\alpha - \beta}{2}\right) - \cos\left(\frac{\alpha + \beta}{2}\right) \right] = \\ & = \left[ 2 \cos \frac{\alpha}{2} \cos \frac{-\beta}{2} \right] \cdot \left[ -2 \sin \frac{\alpha}{2} \sin \frac{-\beta}{2} \right] = \left[ 2 \cos \frac{\alpha}{2} \cos \frac{\beta}{2} \right] \cdot \left[ 2 \sin \frac{\alpha}{2} \sin \frac{\beta}{2} \right] = \end{aligned}$$

$$\begin{aligned}

 &= \sqrt{(1 - \cos^2 \alpha)(1 - \cos^2 \beta)} = \sqrt{\sin^2 \alpha \cdot \sin^2 \beta} = \sin \alpha \sin \beta
 \end{aligned}$$

NOTA: También podríamos haberlo resuelto aplicando el apartado anterior como sigue:

$$\begin{aligned}
 \cos^2 \left( \frac{\alpha - \beta}{2} \right) - \cos^2 \left( \frac{\alpha + \beta}{2} \right) &= 1 - \sin^2 \left( \frac{\alpha - \beta}{2} \right) - 1 + \sin^2 \left( \frac{\alpha + \beta}{2} \right) = \\
 &= \sin^2 \left( \frac{\alpha + \beta}{2} \right) - \sin^2 \left( \frac{\alpha - \beta}{2} \right) \stackrel{(*)}{=} \sin \alpha \sin \beta
 \end{aligned}$$

(\*) Por el apartado b).

**37 Simplifica:**  $\sin \alpha \cdot \cos 2\alpha - \cos \alpha \cdot \sin 2\alpha$

$$\begin{aligned}
 &\sin \alpha (\cos^2 \alpha - \sin^2 \alpha) - \cos \alpha \cdot 2 \sin \alpha \cos \alpha = \\
 &= \sin \alpha \cos^2 \alpha - \sin^3 \alpha - 2 \sin \alpha \cos^2 \alpha = \\
 &= -\sin \alpha \cos^2 \alpha - \sin^3 \alpha = -\sin \alpha (\cos^2 \alpha + \sin^2 \alpha) = -\sin \alpha
 \end{aligned}$$

**38 Resol els sistemes següents donant les solucions corresponents al primer quadrant:**

$$\text{a) } \begin{cases} x + y = 120^\circ \\ \sin x - \sin y = \frac{1}{2} \end{cases}$$

$$\text{b) } \begin{cases} \sin^2 x + \cos^2 y = 1 \\ \cos^2 x - \sin^2 y = 1 \end{cases}$$

• Fes  $\cos^2 y = 1 - \sin^2 y$  i  $\cos^2 x = 1 - \sin^2 x$ .

$$\text{c) } \begin{cases} \sin x + \cos y = 1 \\ x + y = 90^\circ \end{cases}$$

a) De la segunda ecuación:

$$2 \cos \frac{x+y}{2} \sin \frac{x-y}{2} = \frac{1}{2}$$

Como:

$$x + y = 120^\circ \rightarrow 2 \cos 60^\circ \sin \frac{x-y}{2} = \frac{1}{2} \rightarrow 2 \cdot \frac{1}{2} \sin \frac{x-y}{2} = \frac{1}{2} \rightarrow$$

$$\rightarrow \sin \frac{x-y}{2} = \frac{1}{4} \rightarrow \frac{x-y}{2} = 30^\circ \rightarrow x-y = 60^\circ$$

Así:  $x + y = 120^\circ$

$$\underline{x - y = 60^\circ}$$

$$2x = 180^\circ \rightarrow x = 90^\circ \rightarrow y = 30^\circ$$

Luego la solución es:  $(90^\circ, 30^\circ)$

$$\text{b) Como } \left. \begin{array}{l} \cos^2 y = 1 - \sin^2 y \\ \cos^2 x = 1 - \sin^2 x \end{array} \right\}$$

El sistema queda:

$$\left. \begin{array}{l} \sin^2 x + 1 - \sin^2 y = 1 \\ 1 - \sin^2 x - \sin^2 y = 1 \end{array} \right\} \rightarrow \left. \begin{array}{l} \sin^2 x - \sin^2 y = 0 \\ -\sin^2 x - \sin^2 y = 0 \end{array} \right\}$$

$$(\text{Sumando ambas igualdades}) \rightarrow -2 \sin^2 y = 0 \rightarrow \sin y = 0 \rightarrow y = 0^\circ$$

Sustituyendo en la segunda ecuación (por ejemplo) del sistema inicial, se obtiene:

$$\cos^2 x - 0 = 1 \rightarrow \cos^2 x = 1 = \begin{cases} \cos x = 1 \rightarrow x = 0^\circ \\ \cos x = -1 \rightarrow x = 180^\circ \in 2.^\circ \text{ cuadrante} \end{cases}$$

Luego la solución es:  $(0^\circ, 0^\circ)$

$$\text{c) } x + y = 90^\circ \rightarrow \text{complementarios} \rightarrow \sin x = \cos y$$

Sustituyendo en la primera ecuación del sistema:

$$\begin{aligned} \cos y + \cos y = 1 &\rightarrow 2 \cos y = 1 \rightarrow \cos y = \frac{1}{2} \rightarrow y = 60^\circ \rightarrow \\ &\rightarrow x = 90^\circ - y = 90^\circ - 60^\circ = 30^\circ \end{aligned}$$

Luego la solución es:  $(30^\circ, 60^\circ)$

- 45** Representa les funcions:

a)  $y = \cos\left(x + \frac{\pi}{2}\right)$

b)  $y = \sin\left(x + \frac{\pi}{2}\right)$

c)  $y = \cos\left(\frac{\pi}{2} - x\right)$

d)  $y = \sin\left(\frac{\pi}{2} - x\right)$

**46** Resol els sistemes següents donant les solucions corresponents al primer quadrant:

$$\text{a) } \begin{cases} \sin x + \sin y = \sqrt{3} \\ \cos x + \cos y = 1 \end{cases} \quad \text{b) } \begin{cases} \sin^2 x + \cos^2 y = 3/4 \\ \cos^2 x - \sin^2 y = 1/4 \end{cases} \quad \text{c) } \begin{cases} \cos(x+y) = 1/2 \\ \sin(x-y) = 1/2 \end{cases}$$

a) Despejando en la segunda ecuación:

$$\left. \begin{array}{l} \cos x = 1 - \cos y \text{ (*)} \\ \text{Como } \sin x = \sqrt{1 - \cos^2 x} \end{array} \right\} \text{ entonces:}$$

$$\sin x = \sqrt{1 - (1 - \cos y)^2} = \sqrt{1 - 1 - \cos^2 y + 2 \cos y} = \sqrt{2 \cos y - \cos^2 y}$$

Y, sustituyendo en la primera ecuación, se tiene:

$$\begin{aligned} \sin x + \sin y = \sqrt{3} &\rightarrow \sqrt{2 \cos y - \cos^2 y} + \sin y = \sqrt{3} \rightarrow \\ &\rightarrow \sin y = \sqrt{3} - \sqrt{2 \cos y - \cos^2 y} \end{aligned}$$

Elevamos al cuadrado:

$$\sin^2 y = 3 + (2 \cos y - \cos^2 y) - 2\sqrt{3} (2 \cos y - \cos^2 y)$$

$$\sin^2 y + \cos^2 y - 2 \cos y - 3 = -2\sqrt{3} (2 \cos y - \cos^2 y)$$

$$1 - 2 \cos y - 3 = -2\sqrt{3} (2 \cos y - \cos^2 y)$$

$$-2(1 + \cos y) = -2\sqrt{3} (2 \cos y - \cos^2 y)$$

Simplificamos y volvemos a elevar al cuadrado:

$$(1 + \cos y)^2 = 3(2 \cos y - \cos^2 y) \rightarrow$$

$$\rightarrow 1 + \cos^2 y + 2 \cos y = 6 \cos y - 3 \cos^2 y \rightarrow$$

$$\rightarrow 4 \cos^2 y - 4 \cos y + 1 = 0 \rightarrow \cos y = \frac{4 \pm \sqrt{16 - 16}}{8} = \frac{1}{2} \rightarrow y = 60^\circ$$

Sustituyendo en (\*), se tiene:

$$\cos x = 1 - \frac{1}{2} = \frac{1}{2} \rightarrow x = 60^\circ$$

$$\left. \begin{array}{l} \text{b) } \operatorname{sen}^2 x + \cos^2 y = \frac{3}{4} \\ \cos^2 x - \operatorname{sen}^2 y = \frac{1}{4} \end{array} \right\} \text{Sumando:}$$

$$\begin{aligned} \operatorname{sen}^2 x + \cos^2 x + \cos^2 y - \operatorname{sen}^2 y &= 1 \rightarrow 1 + \cos^2 y - \operatorname{sen}^2 y = 1 \rightarrow \\ \rightarrow 2 \cos^2 y &= 1 \rightarrow \cos^2 y = \frac{1}{2} \rightarrow \cos y = \frac{\sqrt{2}}{2} \rightarrow y = 45^\circ \end{aligned}$$

(Solo consideramos las soluciones del primer cuadrante).

Sustituyendo en la primera ecuación:

$$\begin{aligned} \operatorname{sen}^2 x + \cos^2 y &= \frac{3}{4} \rightarrow \operatorname{sen}^2 x + \frac{1}{2} = \frac{3}{4} \rightarrow \\ \rightarrow \operatorname{sen}^2 x &= \frac{3}{4} - \frac{1}{2} \rightarrow \operatorname{sen}^2 x = \frac{1}{4} \rightarrow \operatorname{sen} x = \pm \frac{1}{2} \end{aligned}$$

Nos quedamos con la solución positiva, por tratarse del primer cuadrante. Así:

$$\operatorname{sen} x = \frac{1}{2} \rightarrow x = 30^\circ$$

Luego la solución es:  $(30^\circ, 45^\circ)$

$$\text{c) Como } x, y \in 1.^{\text{er}} \text{ cuadrante} \left. \begin{array}{l} \text{y además } \cos(x+y) > 0 \\ \operatorname{sen}(x-y) > 0 \end{array} \right\} \rightarrow \left\{ \begin{array}{l} x+y \in 1.^{\text{er}} \text{ cuadrante} \\ x-y \in 1.^{\text{er}} \text{ cuadrante} \end{array} \right.$$

Teniendo esto en cuenta:

$$\cos(x+y) = \frac{1}{2} \rightarrow x+y = 60^\circ$$

$$\operatorname{sen}(x-y) = \frac{1}{2} \rightarrow x-y = 30^\circ \text{ (Sumamos ambas ecuaciones)}$$

$$2x = 90^\circ \rightarrow x = 45^\circ$$

Sustituyendo en la primera ecuación y despejando:

$$y = 60^\circ - x = 60^\circ - 45^\circ = 15^\circ$$

La solución es, por tanto:  $(45^\circ, 15^\circ)$

**47** Demuestra que:
